Nature does not look like this, this is too binormal.

Figure: Binormal plot for two strong up-/downdrafts

$$w_1 = 5, w_2 = -5, \theta_{l1} = 5, \theta_{l2} = -5, \alpha = 0.5, \sigma_w = 2, \sigma_{\theta_{l1}} = 2, \sigma_{\theta_{l2}} = 2.$$

To reduce the bimodality we can increase the widths.

Figure: Binormal plot for two strong up-/downdrafts with increased standard deviations

$$w_1 = 5, w_2 = -5, \theta_{l1} = 5, \theta_{l2} = -5, \alpha = 0.5, \sigma_w = 5, \sigma_{\theta_{l1}} = 5, \sigma_{\theta_{l2}} = 5.$$

Adding a third normal is more realistic.

Figure: Trinormal plot for two strong up-/downdrafts with varying δ

$$w_1 = 5, w_2 = -5, \theta_{l_1} = 5, \theta_{l_2} = -5, \alpha = 0.5, \sigma_w = 2, \sigma_{\theta_{l_1}} = 2, \sigma_{\theta_{l_2}} = 2, \\ \sigma_{w_3} = 2, \sigma_{3\theta_l} = 2, \rho_{w\theta_l} = 0.5.$$

A third normal even allows “weird” shapes.

Figure: Trinormal plot for two strong up-/downdrafts with a third peak in the middle

$$w_1 = 5, w_2 = -5, \theta_{l1} = 5, \theta_{l2} = -5, \alpha = 0.5, \delta = 0.5, \sigma_w = 2, \sigma_{\theta_{l1}} = 2, \\ \sigma_{\theta_{l2}} = 2, \sigma_{w3} = 2, \sigma_{\theta_{l3}} = 2, \rho_{w\theta_l} = 0.5.$$

Consider the following prognostic pde [Lar22, p. 21]:

$$\frac{\partial \overline{w'\theta'_l}}{\partial t} = -\overline{w} \frac{\partial \overline{w'\theta'_l}}{\partial z} - \frac{1}{\rho_s} \frac{\partial \rho_s \overline{w'^2 \theta'_l}}{\partial z} - \overline{w'^2} \frac{\partial \overline{\theta'_l}}{\partial z} - \overline{w'\theta'_l} \frac{\partial \overline{w}}{\partial z} + \dots$$

We need to close the third order moment ($\overline{w'^2 \theta'_l}$) by integration over the pdf.

There already exist closures that assume a binormal pdf [LG05], e.g.

$$\overline{w'^2} = \alpha[(w_1 - \overline{w})^2 + \sigma_w^2] + (1 - \alpha)[(w_2 - \overline{w})^2 + \sigma_w^2]. \quad (2.1)$$

We can transform to a trinormal pdf using the following formulas:

$$\overline{w'^2} \frac{1 - \delta \lambda_w}{1 - \delta} = \overline{w'^2}_{dGn} \quad (2.2)$$

$$\overline{w'^3} \frac{1}{1 - \delta} = \overline{w'^3}_{dGn} \quad (2.3)$$

$$\frac{\overline{w'^3}}{\overline{w'^2}^{3/2}} \frac{(1 - \delta)^{1/2}}{(1 - \lambda_w \delta)^{3/2}} = \frac{\overline{w'^3}_{dGn}}{\overline{w'^2}_{dGn}^{3/2}} \quad (2.4)$$

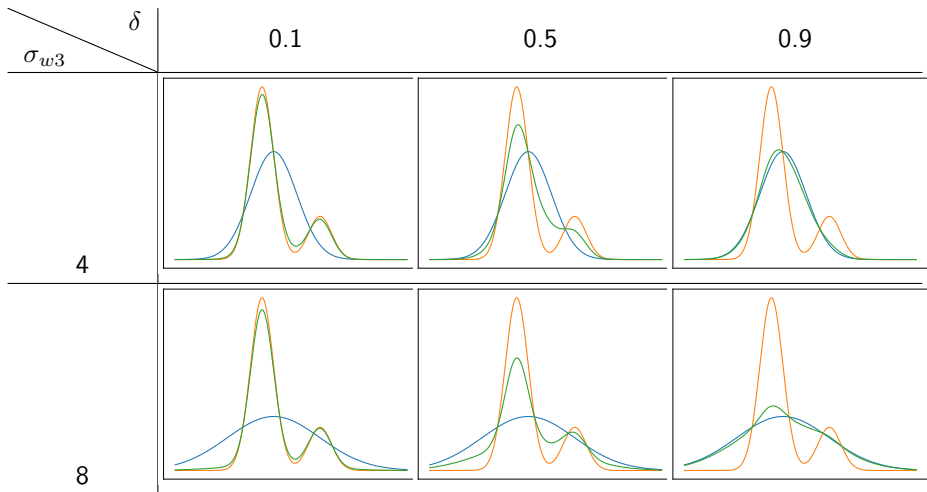

$$\overline{\theta'_l{}^2} \frac{1 - \delta \lambda_\theta}{1 - \delta} = \overline{\theta'_l{}^2}_{dGn} \quad (2.5)$$

$$\overline{w' \theta'_l} \frac{1 - \delta \lambda_{w\theta}}{1 - \delta} = \overline{w' \theta'_l}_{dGn} \quad (2.6)$$

If we substitute in a formula for λ_w (4.6), which will be explained later on, we get

$$\overline{w'^2} \left(1 - \delta \frac{\sigma_{w3}^2}{\overline{w'^2}} \right) = (1 - \delta) \overline{w'^2}_{dGn} \quad (2.7)$$

$$\Longleftrightarrow \overline{w'^2} = \overline{w'^2}_{dGn} - \delta \left(\overline{w'^2}_{dGn} - \sigma_{w3}^2 \right) \quad (2.8)$$

Table: 1D Plots for different δ and σ_{w3}

$w_1 = 5$, $w_2 = -5$, $\alpha = 0.2$, $\sigma_w = 2$. The blue plot represents the third normal, the orange/red one represents the binormal, and the green one represents the mixture. The x and y labels and ticks are omitted for clarity.

The goal of this thesis is to verify that all the transformations work out well.

Forward run (weather forecast)

- Given: \overline{w} , $\overline{w'^2}$, $\overline{w'^3}$, $\overline{\theta_l}$, $\overline{w'\theta'_l}$, $\overline{r_t}$, $\overline{w'r'_t}$, $\overline{\theta_l'^2}$, $\overline{r_t'^2}$, $\overline{r_t'\theta'_l}$.

Forward run (weather forecast)

- Given: \overline{w} , $\overline{w'^2}$, $\overline{w'^3}$, $\overline{\theta_l}$, $\overline{w'\theta'_l}$, $\overline{r_t}$, $\overline{w'r'_t}$, $\overline{\theta'^2_l}$, $\overline{r'^2_t}$, $\overline{r'_t\theta'_l}$.
- Find: Parameters, which describe the shape of the underlying pdf, for ultimately describing higher-order moments, e.g. $\overline{w'^2\theta'_l}$ in terms of lower-order moments.

Backward run (verification direction)

- Given: pdf parameters, e.g. mean, standard deviation

Backward run (verification direction)

- Given: pdf parameters, e.g. mean, standard deviation
- Find: lower- and higher-order moments

Multivariate

We say that a random vector \mathbf{X} is distributed according to a multivariate normal distribution when it has the following joint density function [Ize08, p. 59]:

Definition (pdf of a multivariate normal distribution)

$$f(\mathbf{x}|\boldsymbol{\mu}, \boldsymbol{\Sigma}) = (2\pi)^{-\frac{r}{2}} |\boldsymbol{\Sigma}|^{-\frac{1}{2}} \exp\left(-\frac{1}{2}(\mathbf{x} - \boldsymbol{\mu})^\top \boldsymbol{\Sigma}^{-1}(\mathbf{x} - \boldsymbol{\mu})\right), \mathbf{x} \in \mathbb{R}^r, \quad (3.1)$$

where

$$\boldsymbol{\mu} = \begin{pmatrix} \mu_1 \\ \vdots \\ \mu_r \end{pmatrix} \in \mathbb{R}^r, \text{ and } \boldsymbol{\Sigma} = \begin{pmatrix} \sigma_1^2 & \rho_{12}\sigma_1\sigma_2 & \dots & \rho_{1r}\sigma_1\sigma_r \\ \rho_{12}\sigma_1\sigma_2 & \sigma_2^2 & \dots & \vdots \\ \vdots & \dots & \ddots & \vdots \\ \rho_{1r}\sigma_1\sigma_r & \dots & \dots & \sigma_r^2 \end{pmatrix} \in \mathbb{R}^{r \times r} \quad (3.2)$$

Moments

We denote the skewness and kurtosis by the following:

$$\mathbb{E}[X^3] = \mathbb{E} \left[\left(\frac{X - \mu}{\sigma} \right)^3 \right] = \frac{\mathbb{E}[(X - \mu)^3]}{(\mathbb{E}[(X - \mu)^2])^{3/2}} = \frac{\mu_3}{\sigma^3} \quad (3.3)$$

$$\mathbb{E}[X^4] = \mathbb{E} \left[\left(\frac{X - \mu}{\sigma} \right)^4 \right] = \frac{\mathbb{E}[(X - \mu)^4]}{(\mathbb{E}[(X - \mu)^2])^2} = \frac{\mu_4}{\sigma^4} \quad (3.4)$$

- w - upward wind (or up-/downdraft)
- r_t - total water mixing ratio
- θ_l - liquid water potential temperature

The variables mostly appear in centered form, e.g. $w' = w - \bar{w}$.
For example $\overline{w'^2}$ is the centered variance.

Normal Mixture

$$\begin{aligned} P_{tmg}(w, \theta_l, r_t) = & \alpha(1 - \delta)\mathcal{N}(\mu_1, \Sigma_1) \\ & + (1 - \alpha)(1 - \delta)\mathcal{N}(\mu_2, \Sigma_2) \\ & + \delta\mathcal{N}(\mu_3, \Sigma_3), \end{aligned} \tag{4.1}$$

where \mathcal{N} denotes the multivariate normal distribution, $\alpha \in (0, 1)$ is the mixture fraction of the binormal, and $\delta \in [0, 1)$ is the weight of the third normal.

Mean of first and second component

$$\mu_1 = \begin{pmatrix} w_1 \\ \theta_{l1} \\ r_{t1} \end{pmatrix}, \mu_2 = \begin{pmatrix} w_2 \\ \theta_{l2} \\ r_{t2} \end{pmatrix} \quad (4.2)$$

Covariance matrices of first and second component

$$\Sigma_1 = \begin{pmatrix} \sigma_w^2 & 0 & 0 \\ 0 & \sigma_{\theta_{l1}}^2 & \rho_{\theta_l r_t} \sigma_{\theta_{l3}} \sigma_{r_t 3} \\ 0 & \rho_{\theta_l r_t} \sigma_{\theta_{l3}} \sigma_{r_t 3} & \sigma_{r_{t1}}^2 \end{pmatrix} \quad (4.3)$$

$$\Sigma_2 = \begin{pmatrix} \sigma_w^2 & 0 & 0 \\ 0 & \sigma_{\theta_{l2}}^2 & \rho_{\theta_l r_t} \sigma_{\theta_{l3}} \sigma_{r_t 3} \\ 0 & \rho_{\theta_l r_t} \sigma_{\theta_{l3}} \sigma_{r_t 3} & \sigma_{r_{t2}}^2 \end{pmatrix} \quad (4.4)$$

Placing of the third component

We place the third normal component at the mean in order to simplify the math.

$$\mu_3 = \begin{pmatrix} \overline{w} \\ \overline{\theta_l} \\ \overline{r_t} \end{pmatrix}, \text{ and } \Sigma_3 = \begin{pmatrix} \sigma_{w3}^2 & \rho_{w\theta_l3}\sigma_{w3}\sigma_{\theta_l3} & \rho_{wr_t3}\sigma_{w3}\sigma_{r_t3} \\ \rho_{w\theta_l3}\sigma_{w3}\sigma_{\theta_l3} & \sigma_{\theta_l3}^2 & \rho_{\theta_lr_t3}\sigma_{\theta_l3}\sigma_{r_t3} \\ \rho_{wr_t3}\sigma_{w3}\sigma_{r_t3} & \rho_{\theta_lr_t3}\sigma_{\theta_l3}\sigma_{r_t3} & \sigma_{r_t3}^2 \end{pmatrix} \quad (4.5)$$

Additional definitions

$$\lambda_w \equiv \frac{\sigma_{w3}^2}{w'^2}, \quad \lambda_\theta \equiv \frac{\sigma_{\theta_l 3}^2}{\theta_l'^2}, \quad \lambda_r \equiv \frac{\sigma_{r_t 3}^2}{r_t'^2}, \quad (4.6)$$

$$\lambda_{\theta r} \equiv \frac{\rho_{\theta_l r_t} \sigma_{\theta_l 3} \sigma_{r_t 3}}{r_t' \theta_l'}, \quad \lambda_{w\theta} \equiv \frac{\rho_{w\theta_l} \sigma_{w3} \sigma_{\theta_l 3}}{w' \theta_l'}, \quad \lambda_{wr} \equiv \frac{\rho_{wr_t} \sigma_{w3} \sigma_{r_t 3}}{w' r_t'} \quad (4.7)$$

We say that a random variable X is distributed according to a normal distribution ($X \sim \mathcal{N}(\mu, \sigma^2)$) when it has the following pdf:

Definition (pdf of a normal distribution)

$$f(x|\mu, \sigma^2) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left(-\frac{1}{2} \left(\frac{x - \mu}{\sigma}\right)^2\right) \quad (8.1)$$

Considering that the skewness goes to zero ($Sk_w \rightarrow 0$), we want the pdf to revert to a single normal distribution. Therefore, we need

$$\delta, \lambda_w, \lambda_r, \lambda_\theta, \lambda_{wr}, \lambda_{w\theta}, \lambda_{\theta r} \rightarrow 1. \quad (8.2)$$

In this limit, there are no third-order moments anymore, so they have to go to 0 as well. Also, we want to have that the kurtosis is approaching 3 (value of the kurtosis of a standard normal distribution). To ensure those points, as well as no division by zero in the code, we can define the following properties:

$$\lim_{\delta \rightarrow 1} (1 - \delta) \propto |Sk_w|, \quad (8.3)$$

which means that in the limit as $\delta \rightarrow 1$, $(1 - \delta)$ should “behave as” the absolute value of the skewness of w ,

$$0 < \lim_{\delta \rightarrow 1} \left(\frac{1 - \delta \lambda_x}{1 - \delta} \right) < \infty, \quad (8.4)$$

where x means any of w , r_t , or θ_l ,

$$0 < \lim_{\delta \rightarrow 1} \left(\frac{1 - \delta \lambda_x}{1 - \delta \lambda_y} \right) < \infty \quad (8.5)$$

where x is the same as above and y means any of w , r_t , or θ_l , $x \neq y$,

$$0 < \lim_{\delta \rightarrow 1} (\tilde{\sigma}_w)^2 = \lim_{\delta \rightarrow 1} \left(\frac{\sigma_w^2}{w'^2} \frac{1 - \delta}{1 - \delta \lambda_w} \right) < 1. \quad (8.6)$$

To ensure (8.3), we can use a linear “fit”, which looks like

$$\lambda_w = \lambda_\theta = \lambda_q = (1 - c_1)\delta + c_1, \quad (8.7)$$

where c_1 is some constant. The fit for the other λ 's is

$$\lambda_{w\theta} = \lambda_{q\theta} = \lambda_{wq} = (1 - c_2)\delta + c_2, \quad (8.8)$$

where again c_2 is some constant. Note, that we already have a definition for the λ 's ((4.6)). This definition is just for the backward run though, because we actually have to choose λ in the forward direction.

If we now look at the limit with the proposed fit ((8.7)), where x is one of the three variates, we get:

$$\lim_{\delta \rightarrow 1} \left(\frac{1 - \delta \lambda_x}{1 - \delta} \right) = \lim_{\delta \rightarrow 1} \left(\frac{1 - \delta((1 - c_1)\delta + c_1)}{1 - \delta} \right) = \lim_{\delta \rightarrow 1} \left(\frac{1 - ((1 - c_1)\delta^2 + c_1\delta)}{1 - \delta} \right) \quad (8.9)$$

$$= \lim_{\delta \rightarrow 1} \left(\frac{1 - \delta^2 + c_1\delta^2 - c_1\delta}{1 - \delta} \right) = \lim_{\delta \rightarrow 1} \left(\frac{1 - \delta^2 + c_1\delta(\delta - 1)}{1 - \delta} \right) \quad (8.10)$$

$$= \lim_{\delta \rightarrow 1} \left(\frac{1 - \delta^2}{1 - \delta} \right) - \lim_{\delta \rightarrow 1} \left(\frac{c_1\delta(1 - \delta)}{1 - \delta} \right) \quad (8.11)$$

$$(\text{L'Hôpital}) \stackrel{\left[\frac{0}{0}\right]}{=} \lim_{\delta \rightarrow 1} \left(\frac{-2\delta}{-1} \right) - \lim_{\delta \rightarrow 1} (c_1\delta) \quad (8.12)$$

$$= 2 - c_1. \quad (8.13)$$

Then, we can also define the range of c_1 , which should be $(0, 2)$ because we want to have $0 < \delta\lambda_w < 1$. For the reciprocal, we then have

$$\lim_{\delta \rightarrow 1} \left(\frac{1 - \delta}{1 - \delta\lambda_x} \right) = \lim_{\delta \rightarrow 1} \left(\frac{1 - \delta}{1 - \delta^2 + c_1\delta^2 - c_1\delta} \right) \stackrel{[\frac{0}{0}]}{=} \lim_{\delta \rightarrow 1} \left(\frac{-1}{-2\delta + 2c_1\delta - c_1} \right) \quad (8.14)$$

$$= \frac{-1}{-2 + c_1} = \frac{1}{2 - c_1}. \quad (8.15)$$
