#### Nature does not look like this, this is too binormal.

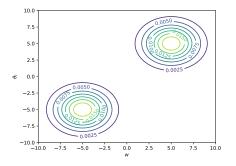

Figure: Binormal plot for two strong up-/downdrafts

$$w_1 = 5$$
,  $w_2 = -5$ ,  $\theta_{l1} = 5$ ,  $\theta_{l2} = -5$ ,  $\alpha = 0.5$ ,  $\sigma_w = 2$ ,  $\sigma_{\theta_{l1}} = 2$ ,  $\sigma_{\theta_{l1}} = 2$ .

### To reduce the bimodality we can increase the widths.

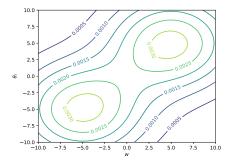

Figure: Binormal plot for two strong up-/downdrafts with increased standard deviations

$$w_1 = 5$$
,  $w_2 = -5$ ,  $\theta_{l1} = 5$ ,  $\theta_{l2} = -5$ ,  $\alpha = 0.5$ ,  $\sigma_w = 5$ ,  $\sigma_{\theta_{l1}} = 5$ ,  $\sigma_{\theta_{l1}} = 5$ .

Sven Bergmann (UWM)

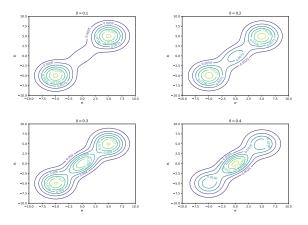

Figure: Trinormal plot for two strong up-/downdrafts with varying  $\delta$ 

$$w_1 = 5$$
,  $w_2 = -5$ ,  $\theta_{l1} = 5$ ,  $\theta_{l2} = -5$ ,  $\alpha = 0.5$ ,  $\sigma_w = 2$ ,  $\sigma_{\theta_{l1}} = 2$ ,  $\sigma_{\theta_{l2}} = 2$ ,  $\sigma_{w3} = 2$ ,  $\sigma_{3\theta_l} = 2$ ,  $\rho_{w\theta_l} = 0.5$ .

 Adding a third normal to CLUBB
 May 3, 2024
 8 / 45

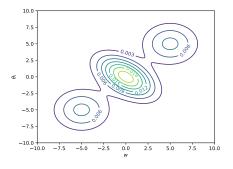

Figure: Trinormal plot for two strong up-/downdrafts with a third peak in the middle

$$w_1=5, \ w_2=-5, \ \theta_{l1}=5, \ \theta_{l2}=-5, \ \alpha=0.5, \ \delta=0.5, \ \sigma_w=2, \ \sigma_{\theta_{l1}}=2, \ \sigma_{\theta_{l2}}=2, \ \sigma_{w3}=2, \ \sigma_{\theta_{l3}}=2, \ \rho_{w\theta_{l}}=0.5.$$

- ◆□ ▶ ◆圖 ▶ ◆ ≣ ▶ ◆ ≣ ・ 釣 Q (~)

Consider the following prognostic pde [Lar22, p. 21]:

$$\frac{\partial \overline{w'\theta'_l}}{\partial t} = -\overline{w}\frac{\partial \overline{w'\theta'_l}}{\partial z} - \frac{1}{\rho_s}\frac{\partial \rho_s \overline{w'^2\theta'_l}}{\partial z} - \overline{w'^2}\frac{\partial \overline{\theta'_l}}{\partial z} - \overline{w'\theta'_l}\frac{\partial \overline{w}}{\partial z} + \dots$$

We need to close the third order moment  $(\overline{w'^2\theta'_l})$  by integration over the pdf.

There already exist closures that assume a binormal pdf [LG05], e.g.

$$\overline{w'^2} = \alpha [(w_1 - \overline{w})^2 + \sigma_w^2] + (1 - \alpha)[(w_2 - \overline{w})^2 + \sigma_w^2].$$
 (2.1)

$$\overline{w'^2} \frac{1 - \delta \lambda_w}{1 - \delta} = \overline{w'^2}_{dGn} \tag{2.2}$$

$$\overline{w^{\prime 3}} \frac{1}{1 - \delta} = \overline{w^{\prime 3}}_{dGn} \tag{2.3}$$

$$\frac{\overline{w'^3}}{\overline{w'^2}^{3/2}} \frac{(1-\delta)^{1/2}}{(1-\lambda_w \delta)^{3/2}} = \frac{\overline{w'^3}_{dGn}}{\overline{w'^2}_{dGn}^{3/2}}$$
(2.4)

$$\overline{\theta_l'^2} \frac{1 - \delta \lambda_\theta}{1 - \delta} = \overline{\theta_l'^2}_{dGn} \tag{2.5}$$

$$\overline{w'\theta_l'} \frac{1 - \delta \lambda_{w\theta}}{1 - \delta} = \overline{w'\theta_{ldGn}'}$$
 (2.6)

4 D L 4 D L 4 E L 4 E L E L 90

If we substitute in a formula for  $\lambda_w$  (4.6), which will be explained later on, we get

$$\overline{w'^2} \left( 1 - \delta \frac{\sigma_{w3}^2}{\overline{w'^2}} \right) = (1 - \delta) \overline{w'^2}_{dGn}$$

$$\iff \overline{w'^2} = \overline{w'^2}_{dGn} - \delta \left( \overline{w'^2}_{dGn} - \sigma_{w3}^2 \right)$$
(2.8)

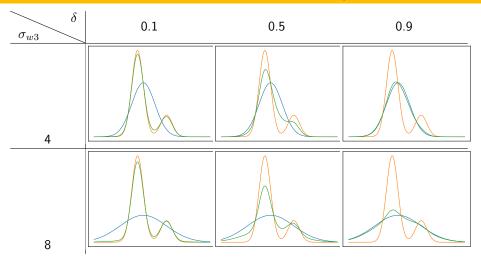

Table: 1D Plots for different  $\delta$  and  $\sigma_{m3}$ 

 $w_1 = 5$ ,  $w_2 = -5$ ,  $\alpha = 0.2$ ,  $\sigma_w = 2$ . The blue plot represents the third normal, the orange/red one represents the binormal, and the green one represents the mixture. The x and y labels and ticks are omitted for clarity.

The goal of this thesis is to verify that all the transformations work out well.

## Forward run (weather forecast)

• Given:  $\overline{w}$ ,  $\overline{w'^2}$ ,  $\overline{w'^3}$ ,  $\overline{\theta_l}$ ,  $\overline{w'\theta_l'}$ ,  $\overline{r_t}$ ,  $\overline{w'r_t'}$ ,  $\overline{\theta_l'^2}$ ,  $\overline{r_t'^2}$ ,  $\overline{r_t'\theta_l'}$ .

## Forward run (weather forecast)

- Given:  $\overline{w}$ ,  $\overline{w'^2}$ ,  $\overline{w'^3}$ ,  $\overline{\theta_l}$ ,  $\overline{w'\theta'_l}$ ,  $\overline{r_t}$ ,  $\overline{w'r'_t}$ ,  $\overline{\theta'^2_l}$ ,  $\overline{r'^2_t}$ ,  $\overline{r'^2_t}$
- Find: Parameters, which describe the shape of the underlying pdf, for ultimately describing higher-order moments, e.g.  $\overline{w'^2\theta'_i}$  in terms of lower-order moments.

# Backward run (verification direction)

• Given: pdf parameters, e.g. mean, standard deviation

## Backward run (verification direction)

- Given: pdf parameters, e.g. mean, standard deviation
- Find: lower- and higher-order moments

#### Multivariate

We say that a random vector  $\boldsymbol{X}$  is distributed according to a multivariate normal distribution when it has the following joint density function [Ize08, p. 59]:

#### Definition (pdf of a multivariate normal distribution)

$$f(\boldsymbol{x}|\boldsymbol{\mu}, \boldsymbol{\Sigma}) = (2\pi)^{-\frac{r}{2}} |\boldsymbol{\Sigma}|^{-\frac{1}{2}} \exp\left(-\frac{1}{2}(\boldsymbol{x} - \boldsymbol{\mu})^{\top} \boldsymbol{\Sigma}^{-1} (\boldsymbol{x} - \boldsymbol{\mu})\right), \boldsymbol{x} \in \mathbb{R}^{r}, \quad (3.1)$$

where

$$\boldsymbol{\mu} = \begin{pmatrix} \mu_1 \\ \vdots \\ \mu_r \end{pmatrix} \in \mathbb{R}^r, \text{ and } \boldsymbol{\Sigma} = \begin{pmatrix} \sigma_1^2 & \rho_{12}\sigma_1\sigma_2 & \dots & \rho_{1r}\sigma_1\sigma_r \\ \rho_{12}\sigma_1\sigma_2 & \sigma_2^2 & \dots & \vdots \\ \vdots & \dots & \ddots & \vdots \\ \rho_{1r}\sigma_1\sigma_r & \dots & \dots & \sigma_r^2 \end{pmatrix} \in \mathbb{R}^{r \times r}$$

$$(3.2)$$

### Moments

We denote the skewness and kurtosis by the following:

$$\mathbb{E}[X^3] = \mathbb{E}\left[\left(\frac{X-\mu}{\sigma}\right)^3\right] = \frac{\mathbb{E}[(X-\mu)^3]}{(\mathbb{E}[(X-\mu)^2])^{3/2}} = \frac{\mu_3}{\sigma^3}$$
(3.3)

$$\mathbb{E}[X^4] = \mathbb{E}\left[\left(\frac{X-\mu}{\sigma}\right)^4\right] = \frac{\mathbb{E}[(X-\mu)^4]}{(\mathbb{E}[(X-\mu)^2])^2} = \frac{\mu_4}{\sigma^4} \tag{3.4}$$

- ullet w upward wind (or up-/downdraft)
- ullet  $r_t$  total water mixing ratio
- ullet  $\theta_l$  liquid water potential temperature

The variables mostly appear in centered form, e.g.  $w'=w-\overline{w}$ . For example  $\overline{w'^2}$  is the centered variance.

### Normal Mixture

$$P_{tmg}(w, \theta_l, r_t) = \alpha (1 - \delta) \mathcal{N}(\mu_1, \Sigma_1)$$

$$+ (1 - \alpha)(1 - \delta) \mathcal{N}(\mu_2, \Sigma_2)$$

$$+ \delta \mathcal{N}(\mu_3, \Sigma_3),$$

$$(4.1)$$

where  $\mathcal N$  denotes the multivariate normal distribution,  $\alpha\in(0,1)$  is the mixture fraction of the binormal, and  $\delta\in[0,1)$  is the weight of the third normal.

## Mean of first and second component

$$\mu_1 = \begin{pmatrix} w_1 \\ \theta_{l1} \\ r_{t1} \end{pmatrix}, \mu_2 = \begin{pmatrix} w_2 \\ \theta_{l2} \\ r_{t2} \end{pmatrix} \tag{4.2}$$

## Covariance between first and second component

$$\Sigma_{1} = \begin{pmatrix} \sigma_{w}^{2} & 0 & 0 \\ 0 & \sigma_{\theta_{l1}}^{2} & \rho_{\theta_{l}r_{t}}\sigma_{\theta_{l}3}\sigma_{r_{t}3} \\ 0 & \rho_{\theta_{l}r_{t}}\sigma_{\theta_{l}3}\sigma_{r_{t}3} & \sigma_{r_{t1}}^{2} \end{pmatrix}$$
(4.3)

$$\Sigma_{2} = \begin{pmatrix} \sigma_{w}^{2} & 0 & 0 \\ 0 & \sigma_{\theta_{l2}}^{2} & \rho_{\theta_{l}r_{t}}\sigma_{\theta_{l}3}\sigma_{r_{t}3} \\ 0 & \rho_{\theta_{l}r_{t}}\sigma_{\theta_{l}3}\sigma_{r_{t}3} & \sigma_{r_{t2}}^{2} \end{pmatrix}$$
(4.4)

## Placing of the third component

We place the third normal component at the mean in order to simplify the math.

$$\mu_3 = \begin{pmatrix} \overline{w} \\ \overline{\theta_l} \\ \overline{r_t} \end{pmatrix}, \text{ and } \Sigma_3 = \begin{pmatrix} \sigma_{w3}^2 & \rho_{w\theta_l 3} \sigma_{w3} \sigma_{\theta_l 3} & \rho_{wr_t 3} \sigma_{w3} \sigma_{r_t 3} \\ \rho_{w\theta_l 3} \sigma_{w3} \sigma_{\theta_l 3} & \sigma_{\theta_l 3}^2 & \rho_{\theta_l r_t 3} \sigma_{\theta_l 3} \sigma_{r_t 3} \\ \rho_{wr_t 3} \sigma_{w3} \sigma_{r_t 3} & \rho_{\theta_l r_t 3} \sigma_{\theta_l 3} \sigma_{r_t 3} & \sigma_{r_t 3}^2 \end{pmatrix} \tag{4.5}$$

### Additional definitions

$$\lambda_w \equiv \frac{\sigma_{w3}^2}{\overline{w'^2}}, \quad \lambda_\theta \equiv \frac{\sigma_{\theta_l 3}^2}{\overline{\theta_l'^2}}, \quad \lambda_r \equiv \frac{\sigma_{r_t 3}^2}{\overline{r_t'^2}}, \tag{4.6}$$

$$\lambda_{\theta r} \equiv \frac{\rho_{\theta_l r_t} \sigma_{\theta_l 3} \sigma_{r_t 3}}{\overline{r_t' \theta_l'}}, \quad \lambda_{w \theta} \equiv \frac{\rho_{w \theta_l} \sigma_{w 3} \sigma_{\theta_l 3}}{\overline{w' \theta_l'}}, \quad \lambda_{w r} \equiv \frac{\rho_{w r_t} \sigma_{w 3} \sigma_{r_t 3}}{\overline{w' r_t'}}$$

### Univaritate

We say that a random variable X is distributed according to a normal distribution  $(X \sim \mathcal{N}(\mu, \sigma^2))$  when it has the following pdf:

#### Definition (pdf of a normal distribution)

$$f(x|\mu,\sigma^2) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left(-\frac{1}{2} \left(\frac{x-\mu}{\sigma}\right)^2\right)$$
 (9.1)
